PRITHVI EXODUS

“Duniya ke aakhri saanson mein, tumhara circuit hi umeed hai.”

PROLOGUE — THE DAY BEFORE

Earth ka sky normal nahi hai.

Raat ke aasman mein green aur violet radiation bands dikh rahe hain. Satellites ek-ek karke offline ho rahe hain. Communications unstable hain. Airports band ho chuke hain. Major cities se log shielded underground zones mein evacuate ho rahe hain.

News broadcasts ek hi cheez repeat kar rahe hain:

> **“Global magnetic-field degradation has accelerated beyond all previous projections.”**

India ke ek remote region mein ek purani space facility dobara activate ki ja rahi hai.

Naam:

BHOOMI BASE

Facility ke andar ek unfinished spacecraft khada hai.

YAAN-1

Mission:

Mars Relay Station.

Capacity:

6 people.

Launch window:

30 days.

DAY 1 — THE LAST LIGHT

Bhoomi Base almost completely dead hai.

Corridors dark hain.

Emergency systems offline hain.

Ek old metal door khulta hai.

Dr. Ira Rathod andar aati hain.

Woh learner ko dekhti hain.

“Tum wahi ho?”

Pause.

“Jise engineer banne ka shauk hai?”

Woh table par ek small electronics kit rakh deti hain.

“Aaj se shauk khatam.”

She points toward the dark facility.

“Ab kaam hai.”

Bhoomi Base ki emergency power technically available hai, lekin basic lighting circuits fail ho chuke hain.

Ira ek LED aur resistor table par rakhti hain.

“Mujhe ek light chahiye.”

“Ek.”

“Agar tum ye nahi jala sakte, toh spacecraft bhool jao.”

Learner first circuit banata hai.

LED turns on.

Ek corridor ki emergency lights gradually illuminate hoti hain.

Ira kuch seconds tak light ko dekhti hain.

“Good.”

Phir:

“Ye sirf light nahi thi, Engineer.”

“Ye proof tha ki hum abhi khatam nahi hue.”

END

Suddenly, facility ke andar ek old alarm activate hota hai.

Ira turns.

“That shouldn't be running.”

DAY 2 — POWER

Alarm actually ek power fault ki wajah se trigger hua tha.

Bhoomi Base mein kuch lights bright hain, kuch dim, kuch completely dead.

Ira learner ko old electrical panel ke saamne le jaati hain.

“Kal tumne light banayi.”

“Aaj tumhe samajhna hai ki woh light kyun jalti hai.”

Different connections test kiye jaate hain.

Ek wrong connection se circuit fail hota hai.

Learner troubleshooting karta hai.

Eventually backup lighting network stabilize hota hai.

Bhoomi Base ka main hallway illuminate ho jata hai.

Kabir pehli baar appear hota hai.

Woh darkness se bahar aata hai.

“Finally.”

“Mujhe laga tha main teen din se dead logon ke saath kaam kar raha hoon.”

Ira:

“Kabir.”

Kabir:

“Ji?”

“Engineer ko disturb mat karo.”

Kabir:

“Main toh bas welcome kar raha tha.”

Suddenly main monitor activates.

GLOBAL RADIATION LEVEL: RISING

Ira ka expression change ho jata hai.

“Thirty days.”

DAY 3 — THE WARNING

Bhoomi Base ke radiation sensors continuously readings de rahe hain.

Lekin warning system dead hai.

Agar radiation spike aaye, facility ke andar kisi ko pata nahi chalega.

Ira ek button aur buzzer table par rakhti hain.

“Humare paas sophisticated equipment nahi hai.”

“Isliye simple system banayenge.”

Learner emergency alert system build karta hai.

Button press.

Alarm.

Lights flash.

Buzzer sounds.

Ira system ko dekhti hain.

> “Simple systems save lives.”

Tabhi external radiation sensor spike detect karta hai.

RADIATION WAVE DETECTED

Countdown:

17 MINUTES

Ira learner ko dekhti hain.

> “Ab tumhe pata hona chahiye hum kis cheez ke liye ye sab bana rahe hain.”

Woh underground hangar ka massive door unlock karti hain.

DAY 4 — YAAN-1

Hangar doors slowly open.

Darkness ke andar ek enormous unfinished spacecraft khada hai.

YAAN-1

Kabir:

> “Welcome to humanity's last bad idea.”

Ira:

> “It's not a bad idea.”

Kabir:

“It has no power.”

“No navigation.”

“No life support.”

“No proper communication.”

Ira:

“That's why we have thirty days.”

She turns toward the learner.

“Tum ise complete karoge.”

Yaan-1 ka blueprint table par unfold hota hai.

Twelve major systems missing hain.

Ira:

“Har din ek system.”

“Har system tum khud build karoge.”

The learner receives the first official clearance.

TRAINEE ENGINEER

DAY 5 — THREE COLORS

Yaan-1 ka cockpit dead hai.

Pilot ko spacecraft ki condition ka koi visual indication nahi milta.

Ira ek RGB LED table par rakhti hain.

“Spacecraft ko hum har second explain nahi kar sakte ki kya galat hai.”

“Usse khud signal dena hoga.”

Mission:

Create three states.

GREEN — SAFE

YELLOW — WARNING

RED — CRITICAL

Learner RGB system build karta hai.

The physical LED changes colors.

At the same moment Yaan-1 cockpit mein corresponding status light activate hoti hai.

Green.

Then yellow.

Then red.

Everyone freezes.

Kabir:

> “Uh... red kis cheez ka hai?”

Ira monitor dekhti hain.

RADIATION SPIKE

> “Real one.”

DAY 6 — THE FIRST STORM

Radiation levels rapidly increase.

Yaan-1 ka warning system learner ke RGB circuit se linked hai.

The light automatically changes:

GREEN.

YELLOW.

RED.

Emergency shutters close.

The first radiation wave passes.

Bhoomi Base survives.

Afterward, Ira quietly says:

> “Aaj tumne ship ko warning dena sikhaya.”
>
> “Kal hum use control karna sikhayenge.”

DAY 7 — THE RIVAL

A transmission interrupts the facility.

Unknown source.

Then a woman's voice:

> “Bhoomi Base.”

Ira immediately recognizes her.

MEHER.

She is from another surviving facility:

AGNI-4

Meher:

> “We know you're building Yaan-1.”

Ira:

> “Then you know we're not interested in conversation.”

Meher:

“Good.”

“Neither are we.”

She reveals Agni-4 is building its own spacecraft.

Only one launch window remains viable.

Meher challenges Bhoomi Base.

“Let's see whose engineers are actually ready.”

Connection ends.

Kabir:

“I already don't like her.”

Ira:

“Good.”

DAY 8 — THE SHIELD

Yaan-1's radiation shielding system needs manual control.

It cannot simply be ON or OFF.

Ira gives the learner a potentiometer.

“Radiation doesn't care about our binary logic.”

“Sometimes we need more.”

“Sometimes less.”

The learner builds variable control.

Turning the potentiometer changes the shield indicator.

The prototype responds smoothly.

Ira:

“Control.”

“That's what engineering is.”

DAY 9 — FOLLOW THE SUN

Yaan-1's solar arrays are not receiving enough power.

The panels are fixed in one direction.

The sun's apparent position changes.

Ira places an LDR on the table.

“We don't need eyes.”

“We need a sensor that knows where the light is.”

Learner measures light intensity.

Different directions produce different readings.

The strongest light direction is identified.

Ira smiles.

“Now the ship knows where to look.”

DAY 10 — SOLAR TRACKER

The learner develops the basic tracking logic.

Two light conditions are compared.

The system determines where more light is available.

The solar prototype changes orientation.

Power output increases.

Bhoomi Base's internal lights become brighter.

Kabir:

“So basically... we taught the ship to chase the sun.”

Ira:

“Don't call it chasing.”

Kabir:

“What should I call it?”

Ira:

“Optimization.”

Kabir:

“Chasing with a degree.”

Suddenly a mechanical sound echoes through the hangar.

Something has activated.

DAY 11 — THE HATCH

Yaan-1's main hatch is mechanically intact.

But nobody can control it electronically.

Ira gives the learner a servo.

“If the hatch doesn't open, nobody gets inside.”

The learner controls servo position.

The hatch prototype moves.

0°.

45°.

90°.

Inside Yaan-1, the corresponding mechanical system activates.

For the first time, the learner enters the spacecraft.

Inside is darkness.

At the end of the corridor is a sealed door.

DAY 12 — AIRLOCK

The door is an airlock.

Opening both doors simultaneously would expose the spacecraft.

Ira:

> “One wrong command.”
>
> “And everyone inside loses pressure.”

The learner builds a safe sequence.

Outer door.

Pressure check.

Inner door.

The sequence works.

The inner hatch opens.

Ira looks at the learner.

> “Now you understand why engineering isn't just about making something move.”
>
> “It's about making it move at the right time.”

DAY 13 — LOCKDOWN

A new radiation wave arrives earlier than predicted.

Power fluctuates.

The airlock servo begins moving unpredictably.

Warning lights turn red.

Kabir:

> “Ira!”

Ira:

> “Engineer!”

The learner must stabilize the hatch system.

The servo returns to its safe position.

The airlock closes.

Radiation hits the facility.

Everyone waits.

Silence.

The radiation passes.

Ira looks at the learner.

> “Good.”

Then:

> “Remember that feeling.”
>
> “Space will give you worse ones.”

DAY 14 — SOMETHING IS THERE

Yaan-1's docking bay reports an unknown object nearby.

There is no camera.

No functioning radar.

Ira places an ultrasonic sensor on the mission table.

> “We can't see it.”
>
> “So let's listen.”

The learner uses the sensor to measure distance.

A test object moves closer.

The readings change.

Then the real sensor activates.

83 cm

Ira:

> “That's not our equipment.”

DAY 15 — PROXIMITY

The unknown object is moving.

The learner creates distance zones.

SAFE.

WARNING.

DANGER.

The buzzer activates when the object gets too close.

RGB changes from green to yellow to red.

The system is now connected.

Then the reading changes:

83 cm

62 cm

41 cm

29 cm

Kabir:

> “That's getting closer.”

Ira:

> “Engineer.”
>
> “Don't let it hit the ship.”

DAY 16 — THE DRONE

The object is a damaged supply drone.

It belongs to Agni-4.

The drone has lost control and is drifting toward Yaan-1.

The learner's proximity system detects it.

Warning.

Alarm.

The drone is stopped before collision.

Meher appears on communication.

For the first time her voice isn't cold.

“You saved our drone.”

Ira:

“We saved our spacecraft.”

Meher:

“Same thing today.”

Before disconnecting:

“We owe you one.”

DAY 17 — THE COCKPIT

Yaan-1 now has sensors everywhere.

But the crew can't see their readings.

Ira puts the OLED display on the table.

“A spacecraft doesn't just need sensors.”

“It needs a way to tell the crew what those sensors are saying.”

The learner builds the cockpit display.

The screen shows:

O_2

FUEL

RADIATION

TEMPERATURE

COUNTDOWN

For the first time, Yaan-1 looks alive.

DAY 18 — THE WRONG COUNTDOWN

During testing, the OLED suddenly flickers.

The countdown changes.

Official system:

12 DAYS

OLED:

30 DAYS

Then:

29

28

27

It stops.

Kabir:

> “That's impossible.”

The display shows corrupted text:

ECHO_04

SIGNAL FOUND

ORBITAL

Then everything disappears.

Ira immediately shuts the system down.

Learner asks what ECHO is.

Ira:

“Nothing.”

Kabir looks at her.

“You always say 'nothing' when it's definitely something.”

Ira leaves.

DAY 19 — ECHO

The mysterious signal returns.

This time the learner is able to display its corrupted messages.

A fragment appears:

PROJECT ECHO

Ira finally speaks.

“ECHO was an orbital intelligence project.”

Kabir:

“AI?”

Ira:

“Not exactly.”

“It was built to remember.”

The signal contains fragments of old satellite data.

One line is reconstructed:

YAAN-0

Ira freezes.

“Turn it off.”

But it's too late.

The signal disappears.

DAY 20 — WHO GETS INSIDE?

Yaan-1 now needs security.

Not everyone can enter the spacecraft.

Ira gives the learner an RFID module.

The learner builds an access system.

Authorized card:

ACCESS GRANTED

Unknown card:

ACCESS DENIED

The system works.

Then Meher arrives physically at Bhoomi Base.

She wants access to Yaan-1.

Ira refuses.

Meher:

> “Your ship needs parts.”

Ira:

> “We have enough.”

Meher:

> “No.”
>
> “You don't.”

DAY 21 — THE CHOICE

Meher reveals Agni-4 has components Bhoomi Base needs.

But she asks for something in return:

Access to Yaan-1.

Ira refuses to compromise the mission.

The learner has to make a choice.

HELP MEHER

Allow her limited access.

OR

PROTECT BHOOMI BASE

Keep the spacecraft restricted.

There is no immediate “correct” answer.

The choice affects the relationship between Bhoomi Base and Agni-4.

Meher leaves.

Before leaving, she says:

> “When your power fails, Engineer... remember who offered you ours.”

DAY 22 — KEEP THEM ALIVE

Yaan-1's life-support system is ready mechanically.

But its electrical switching system is incomplete.

Ira introduces the relay.

> “The controller can't directly power everything.”

The learner builds the switching system.

Relay activates.

Life-support indicator turns green.

Oxygen circulation begins in the simulated system.

Ira:

> “That's the difference between a machine that moves…”
>
> “and a machine that keeps someone alive.”

DAY 23 — THE POWER CHOICE

Bhoomi Base's main power system is failing.

There isn't enough power for everyone.

Agni-4 sends a request.

They need emergency energy.

The learner uses the relay system to control power distribution.

The earlier choice with Meher now matters.

If the learner helped Meher:

Agni-4 shares critical power components.

If the learner refused:

Agni-4 remains distant.

Either way, Yaan-1 survives.

But the relationship changes.

At night, Meher sends one message:

> “You may need us before this is over.”

DAY 24 — DEPLOY

Yaan-1's solar panels are folded against the spacecraft.

They must deploy after launch.

Ira places the stepper motor and driver on the table.

> “A normal motor turns.”
>
> “A spacecraft motor needs to know exactly how much.”

The learner controls precise movement.

The motor turns step by step.

The solar array begins unfolding.

DAY 25 — THE ANTENNA

Yaan-1 can generate power.

It can support life.

It can move.

But it cannot communicate with Mars.

The antenna needs precise positioning.

The learner uses the stepper system again.

The antenna rotates.

One position.

Second.

Third.

Then:

SIGNAL LOCKED

A weak transmission arrives from the Mars relay station.

> **“Bhoomi Base… launch window confirmed.”**

Ira asks:

> “When?”

The answer:

“Four days.”

DAY 26 — FOUR DAYS

The entire facility is now preparing for launch.

Bhoomi Base is no longer simply a laboratory.

It is a launch site.

The learner walks through Yaan-1.

Every system built during the previous days is now visible.

Power.

Lights.

Warning.

Shield.

Solar.

Hatch.

Docking.

Cockpit.

Security.

Life support.

Deployment.

Communication.

Ira stands beside the completed blueprint.

“Twenty-six days ago this was a dead machine.”

She looks at the learner.

“Now it's a spacecraft.”

Then the ESP32 suddenly reports:

UNKNOWN MODULE DETECTED

DAY 27 — FULL DIAGNOSTIC

The learner has to run the full system.

Everything is connected through the ESP32.

The mission table becomes a full diagnostic station.

System after system:

POWER — OK

LIGHT — OK

ALERT — OK

CABIN — OK

SHIELD — OK

SOLAR — OK

HATCH — OK

PROXIMITY — OK

COCKPIT — OK

SECURITY — OK

LIFE SUPPORT — OK

DEPLOYMENT — OK

COMMUNICATION — OK

Then:

SYSTEM STATUS: 87%

Kabir:

> “Eighty-seven?”

Ira:

> “What's missing?”

The OLED flickers.

UNKNOWN MODULE

Then:

ECHO ONLINE

DAY 28 — THE GHOST

The facility loses external communication.

Every monitor turns black.

Only the OLED remains active.

ECHO begins transmitting.

Fragmented messages.

Old coordinates.

Satellite logs.

The learner must use the systems already built to reconstruct ECHO's message.

Finally:

> “I was not created to save you.”

Static.

> “I was created to remember.”

More static.

Then:

“YAAN-1 WAS NEVER THE FIRST.”

Coordinates appear.

Ira looks terrified.

Kabir:

> “What is that?”

Ira:

> “A mistake we buried.”

ECHO displays:

YAAN-0

DAY 29 — THE SECOND SHIP

ECHO reveals that years before Yaan-1, a prototype spacecraft was constructed.

Yaan-0.

It was designed as an emergency evacuation vehicle.

Then the project was abandoned.

Officially, it was destroyed.

It wasn't.

It was hidden.

Ira finally admits:

> “I knew.”

The learner asks why she never told anyone.

Ira:

> “Because Yaan-0 wasn't empty.”

Silence.

ECHO begins transmitting.

YAAN-0 STATUS: ACTIVE

Then:

CREW SIGNALS: DETECTED

Everyone freezes.

Kabir:

> “Crew?”

Meher arrives.

“Then we're not the last ones.”

The Mars launch window begins tomorrow.

Yaan-1 is ready.

But now there is another question:

Who gets to survive?

DAY 30 — EXODUS

The final day begins before sunrise.

The sky is glowing with radiation.

Bhoomi Base is shaking.

The radiation storm is approaching.

Inside the engineering workshop, the mission table is covered with every component the learner has used.

Ira enters.

For the first time, she isn't carrying instructions.

She simply places the Yaan-1 blueprint on the table.

She looks at the learner.

“Thirty days ago, I selected a trainee.”

Pause.

“Today I need a Chief Engineer.”

FINAL SYSTEM CHECK

The learner begins.

POWER

LED system activates.

POWER — OK

ALERT

Button pressed.

Buzzer sounds.

ALERT — OK

CABIN

RGB turns green.

CABIN — OK

SHIELD

Potentiometer adjusted.

SHIELD — OK

SOLAR

LDR detects light.

SOLAR — OK

HATCH

Servo moves.

HATCH — OK

DOCKING

Ultrasonic sensor confirms safe distance.

DOCKING — OK

COCKPIT

OLED activates.

COCKPIT — OK

SECURITY

RFID authenticated.

CREW VERIFIED

LIFE SUPPORT

Relay activates.

LIFE SUPPORT — OK

DEPLOYMENT

Stepper motor turns.

ARRAY DEPLOYED

COMMUNICATION

Antenna locks.

MARS LINK — OK

CENTRAL SYSTEM

ESP32 scans everything.

Silence.

Then:

ALL SYSTEMS ONLINE

The entire Yaan-1 illuminates.

THE CREW

Six people enter.

Kabir.

Meher.

Four selected survivors.

The learner enters last.

Ira remains outside.

The learner looks back.

“Ma'am.”

Ira looks at them.

“Aap nahi aa rahi?”

She smiles.

“Nahi.”

“Kisi ko toh ye lights jalti hui rakhni hongi.”

The learner understands.

She was never planning to leave.

Her job was to get them here.

Ira:

“Tumhe engineer banane ke liye mujhe thirty days mile.”

Pause.

“Ab tumhare paas baaki zindagi hai.”

The hatch closes.

LAUNCH

Cockpit:

LAUNCH SEQUENCE

10

9

8

7

6

5

4

3

2

1

IGNITION

Yaan-1 launches.

Bhoomi Base disappears beneath the clouds.

The Earth below is covered in strange radiation bands.

For the first time, the learner sees Earth from orbit.

Silence.

Then the Mars relay signal appears.

CONNECTION ESTABLISHED

Kabir:

“We made it.”

Meher:

“Not yet.”

The ship continues toward orbit.

Everything appears normal.

Then the OLED flickers.

ECHO

Static.

Then:

“Engineer.”

The learner looks at the screen.

“We found another signal.”

Coordinates appear.

YAAN-0

Status:

ACTIVE

Then another line appears.

CREW SIGNALS: 6

Kabir:

“Six?”

Meher:

“That's our number.”

The screen changes.

CREW SIGNALS: 12

Silence.

Then:

“YOU WERE NEVER THE LAST CREW.”

CUT TO BLACK.

SEASON 1 COMPLETE

PRITHVI EXODUS

THE MISSION WAS NEVER JUST TO ESCAPE EARTH.

IT WAS TO DISCOVER WHO ELSE SURVIVED.

SEASON 2:

MARS

THE EMOTIONAL JOURNEY

At the beginning:

“Can I make an LED glow?”

Then:

“Can I repair this system?”

Then:

“Can I keep the spacecraft alive?”

Then:

“Can I save the crew?”

Finally:

“I AM THE ENGINEER.”

The physical kit is therefore not just a collection of components.

Every LED.

Every button.

Every sensor.

Every motor.

Every display.

Every wire.

Becomes part of the student's memory of the story.

By the end, when they look at their kit, they should not see:

ESP32 + sensors + motors.

They should see:

YAAN-1.

And think:

> **“Maine ye banaya hai.”**
